

How to use VA Relay

A practical V1 tutorial for Mary, Jim and the trainers at The Brands Den.

Use this guide to turn Mary’s onboarding projects into reusable instructions, assigned work, saved evidence, decisions and handovers. It follows the names and responsibilities in **Mary: Onboarding Plan and Projects** and the screens implemented in the supplied starter.

What this guide is based on. The attached V1 source code and setup guide were inspected. This is not a walkthrough of a live, browser-verified deployment. A later Codex cleanup may change labels. Examples with DEMO references, chosen dates, roles, prices or review rules are training suggestions, not facts from Mary’s plan.

The operating idea

A process is the reusable method. A run is one actual piece of work. “Invoice collection and handoff” is a process. “Collect invoice DEMO-INV-001” is a run with its own assignee, deadline, evidence and history.

The app records and coordinates the work. Mary still reads email, updates marketplaces, creates return labels and prepares invoices in the approved external tools. V1 does not perform those actions or verify them independently.

Choose your route

Reader	Start here
Jim or the setup owner	Pages 2–5: create the workspace, invite the team, publish a process and assign work.
Mary	Pages 3, 5–11: find work, save answers, attach proof, ask for decisions and complete tasks.
Trainers and reviewers	Pages 7 and 11: permissions, correction requests, SOP approval and ownership.
Everyone	Pages 12–13 map all 18 projects; pages 14–15 cover reporting, troubleshooting and limits.

First practice session

Use a separate practice workspace and dummy files. Have Jim and Mary sign in with different accounts. Create one invoice run, save and reopen it, request a correction, resubmit it and accept it. Then repeat with a permission request. Do not practice using real marketplace changes or client payments.

Source: Mary onboarding plan, pp. 1–2; starter START_HERE.md §5; docs/V1_SCOPE.md. Full source index: page 15.

Set up the client and team

Create the workspace

1. Sign in. Open **Client workspaces** → **+ New workspace**.
2. Set **Client / business name** to The Brands Den and **Client timezone** to Europe/Amsterdam. Click **Create workspace**. The account that creates it becomes its workspace owner.
3. Open **Settings** → **Your profile**. Each person sets a display name and their actual display timezone, then clicks **Save**. Mary would use Asia/Manila only if that is where she is working; her location is not specified in the plan.

Mary's plan uses Dutch working hours. Enter client deadlines in the timezone shown on the form. Do not manually add a fixed number of hours to convert them.

Suggested tutorial roles — confirm with the business

Person	Example app role	Reason
Jim	Owner	Workspace setup, publication and the financial decisions assigned to Jim.
Mary	VA	Execute assigned runs and write SOP drafts.
Angeli	Manager, only if authorized	Help set up processes, schedules, invitations and handovers.
Regina, Guilbert, Fabian	Client	Request work and review assigned runs. They can update existing handovers when assigned as trainer.

"Client" is an app permission role, not a statement that the person is an external customer. Use Manager only for people authorized to manage the whole workspace. Owner/manager publication and trainer sign-off are separate actions.

Invite Mary and the reviewers

1. Open **Team & access** → **+ Invite a team member**. Enter the person's real email and choose the agreed **Workspace role**.
2. Click **Create invitation link**, then **Copy link**. Send it privately through your normal communication channel. The app does not send this invitation automatically.
3. The invitee opens the link, signs up or signs in with that exact verified email, and clicks **Accept invitation**. After email confirmation, they may need to reopen the invitation link. Links expire after seven days.

Workspace privacy. All active members of a workspace can read its operational records and attachments. Assigning an invoice to Mary does not hide it from other members. Do not put confidential information in a shared workspace unless every member is authorized to see it. Use separate workspaces for unrelated clients.

Source: Mary, p. 1, working hours and trainer assignments; START_HERE.md §§4–5; workspaces.tsx; invitation.tsx; workspace-section.tsx; docs/V1_SCOPE.md.

Know where to work

Screen	Use it for
My Day	Open work assigned to you, follow-up duties and owned issues. It can include future work, not only today's deadlines.
All work	Find task runs, including completed records. The search box searches task titles.
Processes & SOPs	Create/edit drafts, view published SOPs, start runs and manage recurring schedules.
Attention required	Pending permissions, open issues, and runs waiting, blocked or ready for review.
Deadlines	Open runs with due dates. It is not a separate country-by-country compliance database.
Handovers	Record trainer, training stage and process-ownership sign-off.
Weekly report	Workspace totals, on-time final submissions and a copyable summary.
Team & access	Invitations, roles and deliberate offboarding.
Notifications / Activity	Read your notices; inspect recorded actions and decisions.
Settings	Profile timezone, owner workspace settings and manager automation health.

The three records you use most

Process / SOP: reusable instructions, decision boundaries, resources and checklist steps. Drafts must be published before they can be used for runs.

Run: a specific task occurrence. Use a title such as “DEMO | Invoice | INV-001” and a clear order, product, shipment or invoice reference. One process can have many runs.

Issue: a problem linked to a run, with an owner, proposed next action and follow-up date. An unresolved blocking issue prevents submission.

Understand the statuses

Not started → In progress → For review → Completed is the usual reviewed workflow. **Changes requested** means Mary must correct and resubmit. Runs without final review use **Complete work**. **Blocked** and **Waiting on client** keep the work open; **Cancelled** records work a manager deliberately stops.

Overdue is separate. A run can be both “waiting on client” and “overdue.” The original business deadline is not removed by a waiting status. Workspace metric cards are not Mary-only productivity totals.

On small screens, use the **Workspace page** dropdown. Always check the selected workspace before entering client data. After another person saves a decision or comment, refresh the page to see it; V1 is not a live-updating chat feed.

Create Mary's first SOP

Mary must check every listing weekly: Buy Box, category mapping, delivery promise, image/content, unusual prices and offline listings. She fixes what she is allowed to fix, routes other issues and logs every fix.

Prepare a reusable process

1. As Jim or an authorized manager, open **Processes & SOPs**. Under **Start with a template**, find **Weekly listing check** and click **Use template**.
2. For practice, set **Process title** to "Weekly listing check | Amazon | DEMO-SKU-001". Replace the generic SOP with the client-approved method. Add the approved listing and price-plan links under **Resources**, one "Label | actual URL" per line.
3. Review **VA can do**, **Ask first** and **Never do**. For this example: inspect and document; fix only explicitly permitted differences; ask before unapproved price/content changes; never choose strategy or supply-chain actions.
4. Review the checklist below. The supplied generic template does not contain a separate Buy Box step: add one using **+ Add step**. Set required answers, evidence and N/A only where appropriate.

Step / result to record	Suggested configuration
Listing checked for online/offline status	Text or yes/no. An offline result must be logged and routed, not hidden.
Buy Box checked	Required text describing the result.
Category mapping and delivery promise checked	Instructions specify the approved source of truth.
Image and content checked	Record discrepancies against approved materials.
Verified live price recorded	Amount; state the currency in the title/instructions or another text step. File / screenshot evidence.
Fixes and routed issues logged	Required text; write "None" when no issues were found.

5. For the training run, enable **Require review after submission**. Click **Save draft**, then **Publish draft** in the process list. Choose **View SOP** to inspect the published version.

No automatic branching. A saved "No" is still an answered yes/no field. The app does not infer a blocking issue from it. Follow the SOP: create an issue and choose whether it blocks completion. For a check-only process, an authorized reviewer may accept a documented, routed exception rather than a false "everything passed."

Alternative: **+ Create process → Paste an existing checklist → Append as steps**. This appends lines; remove any unwanted "First step." Configure each pasted step before publishing.

Source: Mary, p. 2, project 13; src/lib/templates.ts; ProcessForm in work-forms.tsx; WorkflowRead in workspace-section.tsx.

Assign work and set schedules

Create the first practice run

1. In **Processes & SOPs**, click **Start run** beside the published process. Alternatively choose **+ New work** and select the process under **Start from**.
2. Enter a descriptive **Task title**, set **Assignee** to Mary, and choose Guilbert as the tutorial **Reviewer**. Review is an example training choice; the onboarding plan does not require final approval for every listing check.
3. Set a practice **Due date** in the client timezone. Enter “Amazon | DEMO-SKU-001” in **Order / invoice / product reference**, and the real approved listing link in **Source link**. Click **Create work**.

A reviewed or permission-gated process needs a different active owner, manager or client as reviewer. Mary cannot review her own work. A VA can create work for herself, not assign work to other members.

Make the listing check recur

As owner/manager, open **Processes & SOPs → + Recurring schedule**. The following is an illustrative weekly arrangement, not a deadline from Mary’s plan:

Field	Practice setting
Published process	Weekly listing check Amazon DEMO-SKU-001
Assignee / Reviewer	Mary / Guilbert
Repeat / Day of week	Every week / Friday
Deadline time / Schedule timezone	15:00 / Europe/Amsterdam
Create work ahead of deadline	1 day before

1. Click **Save schedule**. Inspect **Next deadline to generate** and the saved timezone.
2. Click **Generate due work** when the occurrence is inside its lead-time window. It will not create work that is still too far in the future.
3. Check **All work** or Mary’s **My Day** for the run. Already-generated occurrences are not duplicated by running generation again.

Generation is not execution. A recurring schedule creates a checklist run; it does not open Amazon or complete the check. Unattended generation/reminders need the configured worker. Otherwise an owner/manager must generate manually. Check Settings → Automation health.

One schedule creates one run per occurrence. It does not create a separate run for every SKU or channel. For a small pilot, duplicate a listing-specific process and schedule for each target, or agree on a batch-audit process with a coverage file. Do not assume a product-list integration.

Do not create a manual and scheduled run for the same actual obligation by accident. Pausing stops future generation, not existing runs. Editing affects future generation; resuming may generate missed occurrences. Check the next deadline after each change.

Source: TaskForm and ScheduleForm in work-forms.tsx; Processes & SOPs in workspace-section.tsx; START_HERE.md §6; docs/V1_SCOPE.md.

Execute, save and attach proof

1. Open **The Brands Den → My Day**. Select the correct run, check the reference, assignee and deadline, then click **View SOP**. Use the run's saved SOP version, not an unrelated newer draft.
2. Use **Update status / follow-up → In progress / reopen**, enter a reason such as "Starting the scheduled listing check," and click **Update status**. Complete the real check in the external tool.
3. Open a step's **How to do this / expected result** instructions. Enter an honest result or check **I completed and checked this step** only after doing it.
4. Click **Save step** and wait for **Saved**. Work on one changed step at a time during the pilot. Only successfully saved answers survive a reload.
5. When proof is needed, expand **Attach evidence**, choose the file and **Evidence label**, then click **Upload and attach**. Wait until it appears in the file list and confirm that **Open** works.
6. Repeat for the remaining steps. Add a task comment to explain important context. Resolve required permissions or blocking issues before submission.
7. Click **Submit for review**, or **Complete work** when the process does not require final review. A fully answered counter alone is not a completion record.

Before-and-after evidence

For a price-change step configured with **Before and after files**, upload the initial screenshot with label **Before** and the verified result with label **After**. Two files labelled General do not satisfy that requirement. If the step is permission-gated, obtain permission before the app unlocks its answer/upload controls; do not make the external change while waiting.

When something interrupts the work

If an upload fails, use **Retry upload**. Use **Discard selection** to abandon a selected file; this does not satisfy required proof or delete an attached file. Do not leave while an upload is unfinished or the page warns of unsaved work.

If you see a stale-save warning, stop, refresh and inspect the newer saved state. Do not force an overwrite or assume your unsaved text has been retained. Avoid simultaneous editing of the same run during the pilot.

Files and safety. The starter accepts PNG, JPEG, WebP, PDF, plain text and CSV up to 10 MB. It does not accept Word or Excel attachments directly. Use an approved resource link or an appropriate permitted export. Remove unnecessary customer details before upload; never upload passwords, access tokens or payment credentials.

Do not use **Not applicable** merely because a step is difficult. It is available only when allowed by the template and requires a reason. Permission-gated steps that always apply should not be configured to allow N/A.

Source: run-workspace.tsx: RunWorkspace, StepEditor and EvidenceUpload; src/lib/domain.mjs; docs/V1_SCOPE.md.

Ask, wait, correct and finish

A. Ask before an action

A template's **Permission before action** setting is different from final review. For a marketplace campaign registration, select Jim as reviewer for that run because Mary's plan requires Jim's go-ahead.

1. Mary opens the locked step and clicks **Request permission**. She describes the exact proposed action and reason, then sends it. Do not act externally yet.
2. Jim opens **Attention required** → **Permission before action**, opens the run and finds **Permission history** → **Make decision**.
3. Jim selects **Approve this action** or **Reject / request clarification**, enters a decision note, and clicks **Record decision**. Mary refreshes and proceeds only with the approved action. If the proposal changes, clarify it rather than treating old permission as unlimited authority.

B. Report an exception with an owner

1. Inside the run, open **Issues & exceptions** → **+ Report issue**.
2. Fill in **Issue title**, **What happened / what did you investigate?**, **Recommended next action**, **Next-action owner** and a **Follow up** date. Leave "Must be resolved before this run can be submitted" selected only when it should block completion.
3. Click **Create issue**. The issue owner or a manager later uses **Resolve issue**, records what changed and clicks **Resolve**. A comment alone does not close the issue.

To show that the entire run is waiting, also use **Update status / follow-up**. Select **Waiting on client** or **Blocked**, name the active team member responsible, explain what is needed, and set the follow-up owner/date. This status action and the issue record are separate. Keep them consistent.

Waiting for an outside party. The waiting-person selector contains workspace members, not carriers or suppliers. Select the internal person responsible for follow-up and identify the outside party in the reason. Do not invite a courier or supplier just to populate that field.

C. Review completed work and return corrections

1. Mary saves the required answers and evidence, then selects **Submit for review**. The run becomes read-only for execution while it is **For review**.
2. The reviewer opens the run from **Attention required**. In **Review submitted work**, choose **Request corrections**, explain the correction and click **Record review**.
3. Mary refreshes, reads **Reviewer feedback**, fixes the affected steps, saves them and resubmits. The reviewer then chooses **Accept and complete** → **Record review**.

Example feedback: "The evidence does not show the product reference. Add a screenshot that identifies DEMO-SKU-001." Do not approve simply because all boxes are answered. A pending review can still pass its business deadline; reporting separates final submission timing from acceptance.

Source: Mary, p. 2, project 9; run-workspace.tsx; workspace-section.tsx; supabase/migrations/202610060002_workflows.sql.

Mail, deadlines and invoice collection

Daily platform mail and deadline register

Mary's plan says to read marketplace and compliance mail every day, register every deadline, handle routine requests and send other requests to the owner with a proposal.

1. Install **Daily marketplace mail review**, adapt the approved account links and instructions, save and publish. Create a daily schedule, or confirm the agreed coverage before choosing weekdays. Set a suitable client-local deadline and lead time; the plan does not specify an exact hour.
2. Mary opens the run and reviews the actual mail/marketplace portals. She saves the review step, then records each message, source and exact deadline in **Record deadlines and sources**.
3. For each actionable deadline, also create **+ New work** with its own title, reference, due date and source link. Typing a deadline in the mail-check notes does not create a dated task automatically. VAs create their own assigned tasks; a manager can assign other people.
4. Use **Log exceptions or record "None"** and linked issues to route non-routine matters. Open **Deadlines** to confirm the new dated runs are visible.

Example: "DEMO | Marketplace policy response | Case-001." Preserve the exact source wording. If a message says "within five working days," record that wording and ask the owner to confirm the actual date rather than inventing one. The starter has no holiday-calendar engine.

Receipts and invoice inbox

The plan starts with receipts and subscriptions, then all expenses: approximately 60 invoices per month, sent individually to bookkeeping. Mary also finds missing invoices and answers standard accountant questions with Jim copied.

1. Install **Invoice collection and handoff**, adapt the bookkeeping destination, save and publish. Use **one run per invoice**, not one monthly checkbox. Select Angeli as a practice reviewer only after the team agrees.
2. Create "DEMO | Collect invoice | INV-001," assign Mary, and enter the supplier/period/reference. Mary locates the invoice and saves **Locate the invoice**.
3. Mary checks the document against the request, saves **Verify invoice details**, and attaches the permitted invoice file. She sends it through the approved external channel, then saves **Record the bookkeeping handoff reference** with the real message reference or receipt.
4. If the invoice is missing, leave the locating step unfinished. Create an issue with an internal next-action owner and follow-up date. Submit only when the required handoff is actually complete.

No automatic sending or payment. VA Relay does not email the invoice to bookkeeping, copy Jim on an accountant reply, calculate tax or pay the supplier. Those actions stay in the approved tools. The run records their references and outcomes.

Source: Mary, p. 1, project 2 and p. 2, project 17; src/lib/templates.ts; TaskForm; Deadlines view in src/lib/data.ts.

Returns and B2B orders

Return labels and shipment follow-ups

Regina decides on returns and refunds. Mary creates the label in Sendcloud or Returnless and tracks the shipment until it arrives. Making the label alone does not complete this project.

1. Create and publish a client-specific **Return label and shipment follow-up** process. Include required steps for Regina's decision reference, label creation, tracking reference and arrival verification. Set evidence requirements proportionately.
2. Start one run per shipment, such as "DEMO | Return | RET-001." Assign Mary; use Regina as reviewer in this example. Link the order or approved return record.
3. Mary verifies Regina's decision, then creates the label externally and records the tracking link. Require **Permission before action** on the label step if the team wants Regina's in-app approval before execution.
4. While the parcel is travelling, keep arrival uncompleted. Record the next tracking check using **Update status / follow-up** or a linked issue. Select Mary as the internal follow-up owner and explain that the carrier is the external dependency.
5. On arrival, record the received status and proof. Resolve any open blocking issue, update the run's waiting status, save the final step and submit or complete. Mary does not approve or issue a refund merely because the parcel arrived.

B2B pro formas and invoices

Regina or Jim requests the invoice. The plan includes an approved template with 0% VAT reverse charge where appropriate and requires checking that the bank transfer arrived before the order ships. This guide does not determine the tax treatment.

1. Create a process with: request/order reference; pro forma prepared; final invoice prepared as instructed; incoming transfer checked; verification reference recorded. Put the approved invoice-template link in **Resources**. Use allowed N/A only for genuinely inapplicable stages.
2. Start "DEMO | B2B invoice | B2B-001," assign Mary, and choose the appropriate separate reviewer. Enter the due date, reference and source link.
3. Mary prepares documents in the approved invoicing tool and attaches permitted copies. She uses the exact client-approved tax instruction; uncertain treatment or conflicting details go to Regina or Jim.
4. If the transfer has not arrived or cannot be verified, leave its step incomplete and raise a blocking issue. Tell the responsible shipping person through the actual operational channel that verification is outstanding. Record that communication.

The app is not a shipping control. An unchecked step or blocking issue in VA Relay does not stop a warehouse or marketplace from dispatching an order. Only the business's real shipping process can enforce that hold. Never use a dummy screenshot as evidence of payment.

Source: Mary, p. 1, projects 5–6; ProcessForm and TaskForm in work-forms.tsx; run-workspace.tsx; docs/V1_SCOPE.md.

Promotions and compliance

Promotion start, promotion end and price changes

Mary enters promotion prices on every marketplace at the start, removes them at the end and checks before and after. Campaign registration needs Jim's go-ahead. Standard price changes must match the plan.

1. Create separate processes or runs for **Register campaign**, **Start promotion** and **End promotion** when they are distinct obligations. Use the same campaign reference in their titles. V1 does not automatically create linked start/end tasks from one campaign date.
2. For registration, configure **Permission before action** and select Jim as run reviewer. For price execution, specify the approved price-plan source, target product and channel. Guilbert can be the tutorial execution reviewer if authorized.
3. Create start and end runs in advance with the agreed client-local deadlines. Use one run per product/channel or an explicitly defined batch coverage checklist. The app does not fan out work to marketplaces automatically.
4. Mary records the original state, makes only the authorized external change and verifies the live result. On a step requiring **Before and after files**, attach one file labelled Before and another labelled After.
5. At the end date, Mary executes the separate end run and verifies the approved post-promotion price. Do not assume that completing the start run schedules removal or that the original price is always the correct restoration price.

Illustrative practice values: record an approved change from EUR 89 to EUR 69. These are dummy values, not prices from Mary's document. The app's amount field does not choose a currency automatically; state it explicitly.

Staxxer compliance requests and WEEE weights

The plan says monthly WEEE weights are due **before the 10th**. It does not define the exact cutoff hour, and it must not be silently changed to "on the 10th."

1. Confirm the deadline, reporting period, country, source data and submission channel with Guilbert. Create a **Staxxer monthly WEEE submission** process covering preparation, checking, sending and proof of submission.
2. Once agreed, create a monthly schedule. Example only: internal deadline on the 8th at 15:00 Europe/Amsterdam, generated seven days ahead. That creates a preparation buffer; it is not a newly asserted official deadline.
3. Include the country/reporting period in the title, instructions or a required text step. Create separate runs where countries or obligations differ. **Deadlines** displays dated runs, not a structured compliance database with automatic rules.
4. Mary gathers and verifies the requested data, submits externally, attaches the file or submission reference and completes the checklist. Missing data becomes an issue assigned to Guilbert with a follow-up date; the real deadline stays visible.

Source: Mary, p. 2, projects 9–10 and 12; ScheduleForm; StepEditor/EvidenceUpload; docs/V1_SCOPE.md.

Payment issues and process handovers

Investigate a payment or account problem

Mary investigates failed payments, reminders, blocked accounts and payout problems that prevent refunds. Jim pays and approves. Investigation is not permission to execute a financial action.

1. Create “DEMO | Investigate payout issue | PAY-001,” assign Mary and select Jim as reviewer. Include the account/case reference and an approved source link, without credentials.
2. Record what happened, the visible message, the affected account and what was checked. Use **+ Report issue** to state the recommended next action, set Jim as next-action owner and choose a follow-up date.
3. Use **Waiting on client** when Mary needs Jim’s decision. Jim records his decision in the run; use a configured permission gate where execution requires it. Jim handles the external payment himself.
4. Mary records and verifies the outcome she is authorized to check. Resolve the issue with an explanation. Submit for review or complete only when the agreed task outcome is met. “I escalated it” is completion only for a task explicitly scoped to investigation and escalation.

Record the handover, not just the task

The plan’s method is: the trainer demonstrates, Mary performs with supervision, Mary performs alone, Mary writes the SOP, the SOP is approved, then the project becomes hers.

1. The owner/manager opens **Handovers** → **+ Add handover**. Select the process, Mary as **VA / trainee**, the named trainer and **not started**. Click **Save**.
2. After each real training activity, the manager or assigned trainer selects **Update** and records the stage and a progress note.

App stage	What it represents
demonstration	Trainer has shown the work in a call or Loom.
guided run	Mary has executed with the trainer watching.
independent run	Mary has executed alone and the result has been checked.
sop drafted	Mary has written and saved the process draft.
sop approved	Owner/manager has published the agreed SOP; an authorized person other than Mary records sign-off with a note.
owned	The agreed process responsibility is formally handed over and recorded.

Use Angeli for projects 1–4, Regina for 5–7, Fabian for 8, Guilbert for 9–14 and Jim for 15–18. The plan schedules initial handover on October 6–9 and the week of October 12, 2026, with takeover continuing afterward. Record actual progress; dates alone do not prove completion.

Two distinct actions. **Publish draft** does not advance the handover automatically. **owned** does not change app roles or enforce competency. Existing runs keep their original SOP snapshot after a new version is published.

Source: Mary, p. 1, handover method and first-two-weeks table; pp. 1–2 trainer groups; p. 2 project 18; TrainingForm; save_training SQL.

12 / KEEP THE ORIGINAL PROJECT STRUCTURE

Map every project: 1–8

This is a proposed way to organize Mary’s work in V1. Project names, trainers and responsibilities come from the plan. Record choices and completion criteria below are tutorial suggestions. Where the plan has no cadence, agree it instead of inventing a daily or weekly deadline.

# / Project / Trainer	How to represent it in VA Relay	Outcome or boundary to preserve
1 Accounts and access Angeli	One onboarding process and handover. Record each approved tool/storefront and access-test result. Add resource links.	Access is usable; missing permissions have an owner. Mirakl AI support agent and Claude are external references in the plan, not V1 integrations. Never store passwords.
2 Receipts and invoice inbox Angeli	Use Invoice collection and handoff. One run per invoice, plus separate missing-document follow-ups when needed.	Invoice reaches bookkeeping with a handoff reference. Standard accountant replies keep Jim in cc in the real email tool.
3 Admin trackers Angeli	Use Processes & SOPs and Handovers for process status/training. Use dated runs for obligations; link the approved folder/index.	SOP status and responsibility are clear; requirements, country, deadline and owner remain findable. No automatic folder cleanup or dedicated compliance-country fields.
4 Amazon account admin Angeli	A check process at the agreed cadence; individual runs for policy follow-ups and portal return cases.	Notifications and cases are handled or routed. Regina handles the customer; Mary handles Seller Central.
5 Return labels and shipment follow-ups Regina	One run per return/shipment, with decision reference, label, tracking and follow-up.	Shipment arrival verified; Regina still decides the return and refund.
6 B2B pro formas and invoices Regina	One request-driven run per order. Resource links to approved templates; document and incoming-payment check steps.	Approved documents prepared and transfer arrival checked before external shipping. Mary does not invent tax treatment.
7 Marketplace rules in one place Regina	One maintained reference/SOP per channel, built from Regina’s finished research; link the approved rule page.	Return policy, label payer and refund rules are together. Not a new research assignment or authority to change rules.
8 Content research and organisation Fabian	One run per research/organization request, with reference links and a deliverable folder.	Research and files are ready for Fabian. Fabian decides and creates; Mary prepares.

Title pattern for easy title search: **[Function] | [Channel or country] | [Reference]**. Example: “Returns | Amazon | DEMO-RET-001”. Search does not cover every attachment, comment or reference field in V1, so put the important identifier in the title too.

Source: Mary, p. 1, projects 1–7; p. 2, project 8; source app: templates.ts, data.ts, workspace-section.tsx. All app mappings are proposed configuration.

Map every project: 9–18

# / Project / Trainer	How to represent it in VA Relay	Outcome or boundary to preserve
9 Promotions Guilbert	Separate registration, start and end obligations; approved price source and before/after evidence.	Jim's go-ahead for campaign registration. Cover every required marketplace and verify removal at the end.
10 Price adjustments Guilbert	A run per requested change/product/channel, or a defined batch with a coverage file.	Each price matches the plan; checks before and after. No independent pricing strategy.
11 FiveX cost rules Guilbert	Run per requested cost-rule update; separate inventory-value request when asked.	Landed costs/rules updated in FiveX using approved data; evidence and source references retained.
12 Staxxer compliance requests Guilbert	Monthly process plus request-driven tasks for other documents; confirmed deadlines and country/period labels.	Requested data sent on time. WEEE weights: before the 10th, exact cutoff to be confirmed.
13 Weekly listing check Guilbert	Listing-specific weekly runs, or a deliberate batch-audit checklist with coverage evidence.	Every listing covered: Buy Box, category, delivery, image/content, price and online status. Log each fix or route.
14 ChannelDock sync and stock alerts Guilbert	Checks at the agreed cadence; an issue per significant sync error or stock alert.	Check each channel, fix or route sync errors, pass low-stock alerts to Guilbert. No automatic reorder decision.
15 Back-end changes on storefronts Jim	Request-driven run with approved settings/text, portal reference and verification evidence.	Apply approved changes. First work is the MediaMarkt profile fixes from Regina's audit; Mary does not draft legal policy.
16 New product launches Jim	One launch run per product/channel, with approved content and publishing checkpoints.	Listing created, content entered, pushed live and checked. V1 does not publish it to the marketplace.
17 Platform mail and deadline register Jim	Daily mail process plus a separately dated run for every actionable obligation.	Handle routine requests; send others to the owner with a proposal. Notes alone do not generate tasks.
18 Payment and account issues Jim	Investigation run, owned issue, follow-up and Jim's decision.	Identify what happened and what must happen next. Jim pays and approves.

Keep the later work later

The plan places product/channel margins, OPEX, subscription audit, payout reconciliation and cashflow/forecasts from month 3. Add request/checklist records when the team starts those activities, with links to their actual sheets. V1 is not an accounting or forecasting engine.

The plan excludes strategy and departmental decisions, creating ads/content, answering customers, supply-chain decisions, SEO, webshop development and paying invoices. Put these boundaries into the relevant SOPs. An app Manager role does not grant business authority beyond the team's actual agreement.

Source: Mary, p. 2, projects 9–18, Later from month 3, and Not yours; docs/V1_SCOPE.md. App mappings are proposed configuration.

Daily routine, reporting and safe practice

Mary's start-of-shift routine

Open the correct workspace and **My Day**. Read overdue work and due follow-ups first, then upcoming deadlines. Open **Notifications** and inspect reviewer feedback. Start the highest-priority agreed work, read its SOP and save each completed step. Review **Deadlines** for upcoming obligations even when the task is not due today.

Mary's end-of-shift routine

Finish saving changed steps and confirm uploads. Submit work that is ready. Give every unfinished item an accurate status, next action, responsible person and follow-up date where needed. Add a factual comment when useful; do not mark waiting work complete merely to clear the queue.

Jim's review and weekly report

Open **Attention required** for pending permissions, reviews and owned issues. Make decisions in the actual run, not only in a chat message. Then open **Weekly report** → **Copy weekly summary** and paste it into the team's existing communication channel. Add highlights manually; V1 does not write an AI narrative or send this summary on a weekly schedule.

The counters cover the whole workspace. The on-time measure is final submission timing for accepted work completed that week with deadlines; it is not hours worked or individual-VA scoring. Owner, manager and client roles can export **task CSV** or **workspace JSON**. A VA can copy the summary but has no export button in this starter.

Practice before using live client records

Exercise	Expected outcome
Save and reopen a dummy invoice run	Saved answers remain. Unfinished steps are still unfinished.
Submit without required proof	The app refuses to complete the run.
Reviewer requests corrections	Mary can read feedback, correct, save and resubmit.
Request permission as Mary	A separate reviewer decides; Mary refreshes before proceeding.
Mark a past-due task waiting	Waiting and overdue are both visible.
Generate the same due schedule again	No duplicate occurrence is created.
Try another client's workspace	It is not available without explicit membership.

Common problems

No Start run: save and publish the process first. **No reviewer:** invite a separate active owner/manager/client. **Submit disabled:** save changed answers and finish/discard the pending file selection. **Submission still fails:** inspect missing answers, proof, permission gates and open blocking issues.

No scheduled run: check lead time, process publication, active assignments and cron/manual generation. **Old instructions still shown:** the run intentionally keeps its original snapshot. **No notification email:** check configuration; use in-app notices. **A decision is not visible yet:** refresh.

Boundaries and source index

What not to assume in this V1

There are three generic starter templates, not 18 preloaded Mary-specific processes. Additional processes in this guide are created and approved by the team. No client contacts, real files, real prices or actual onboarding progress are preconfigured.

The app has no marketplace, Gmail, Slack, Drive, FiveX, Staxxer, Sendcloud, Returnless or ChannelDock integration. Resource links open the real tools. Evidence and comments record reported work; they do not independently prove an external action.

Saving is explicit; there is no offline mode or automatic answer autosave. Work notifications are not a realtime feed. Unattended scheduling/reminders need the worker configuration. Invitation links and weekly summaries are shared manually.

Scheduling offers daily, weekdays, weekly and monthly fixed deadlines. It has no business-holiday calendar, quarterly builder, completion-relative schedule or campaign start/end automation. Change existing deadlines deliberately with **Reassign / deadline**, including a reason; a schedule edit does not rewrite existing runs.

A manager can use **Reassign / deadline** for an absence. Use **Team & access → Offboard** only when access should actually be removed: choose a replacement and enter the handover note. History remains. The app rejects transfers that create self-review. Existing exported/downloaded files cannot be recalled.

Exports contain records and attachment references, not attachment bytes. They are not backups or imports. Sensitive uploads need a tested deployment, authorized access and the project's documented backup/restore process. The supplied starter has not been live-browser-verified in this tutorial.

Source index

Source	What was used
Mary - Onboarding Projects Overview.pdf	Both pages, visually inspected: exact project names, trainers, responsibilities, handover method, first-two-weeks plan, later activities and exclusions.
VA_Relay_START_HERE.md / START_HERE.md	Configuration prerequisites; first real flow; verified-email invitations; optional worker/email; manual summary limits; troubleshooting.
src/components/workspaces.tsx; shell.tsx; invitation.tsx	Workspace creation, navigation, display timezone context and acceptance labels.
src/components/work-forms.tsx; workspace-section.tsx; run-workspace.tsx	Actual buttons, fields, schedule options, handovers, permissions, evidence, reviews and reporting.
src/lib/config.ts; templates.ts; data.ts; domain.mjs	Menu names, three starter templates, query behavior, statuses and submission checks.
supabase/migrations/202610060002_workflows.sql; docs/V1_SCOPE.md	Trainer sign-off rules, workflow permissions, configured behavior and explicit limitations.

All code paths above are relative to **va-workflow-v1/** in **VA_Relay_V1_Nextjs_Supabase_Starter.zip**. Proposed roles, review choices, file requirements, internal deadlines and DEMO examples are configuration suggestions to confirm with The Brands Den.

The daily rule. Read the instructions. Do the actual work. Save the result. Attach the right proof. Ask the right person when needed. Complete only the outcome you were assigned.
