

How to use VA Relay

Plan the work. Follow the steps. Keep the right people informed.

Use VA Relay to organize client work, follow standard operating procedures (SOPs), save evidence, request decisions and hand over responsibilities. This guide is for virtual assistants, business owners, team managers, trainers and reviewers across different types of work.

Using this guide. The walkthrough describes V1. Examples, task references and schedules are illustrative. Agree on responsibilities, deadlines and review rules with your client before using them for live work. Available actions depend on your workspace role and configuration.

The operating idea

A process is the reusable method. A run is one actual piece of work. “Weekly file and document check” is a process. “File check | Shared folder | DEMO-001” is one run with its own assignee, deadline, answers, evidence and activity history.

VA Relay coordinates and records the work. You still read email, edit documents, prepare reports or make approved updates in the appropriate external tools. A checked box does not perform or independently verify an external action.

Choose your route

Reader	Start here
Owner or manager	Pages 2–5: set up a workspace, invite the team, publish a process and assign work.
Virtual assistant	Pages 3 and 6–10: find work, save results, attach proof, ask for decisions and finish tasks.
Trainer or reviewer	Pages 7 and 11: make decisions, request corrections and record training sign-off.
Everyone	Pages 12–13: example task library. Pages 14–15: routines, practice, reporting and troubleshooting.

Your first practice session

Use a separate practice workspace and dummy files. Have a VA and reviewer sign in with separate accounts. Create one task, save and reopen it, submit it, request a correction, resubmit it and accept it. Repeat with a permission request. Do not practice by changing live client records or making payments.

Set up the client and team

Create the workspace

1. Sign in and open **Client workspaces** → **+ New workspace**.
2. Enter the **Client / business name** and select the client's agreed operational timezone under **Client timezone**. For practice, use a neutral label such as "Practice workspace." Click **Create workspace**. The creator becomes the workspace owner.
3. Open **Settings** → **Your profile**. Each person sets their own display name and actual display timezone, then clicks **Save**.

Enter deadlines in the timezone shown on each form. Keep the client's operational timezone separate from your personal display timezone. Check the displayed date and time instead of manually adding a fixed number of hours.

Choose the appropriate role

Role	Typical use
Owner	Create and manage the workspace, publish processes and oversee access.
Manager	Manage processes, assignments, schedules, invitations and handovers when authorized.
Client	Request work and review assigned runs. This is a permission role, not necessarily an external customer.
VA	Execute assigned work, create personal tasks and write SOP drafts. A VA cannot review their own work.

Trainer and reviewer are responsibilities on a record, not additional workspace roles. Give broad Manager access only to someone authorized to manage the entire client workspace.

Invite the VA and reviewers

1. Open **Team & access** → **+ Invite a team member**. Enter the person's email and select the agreed **Workspace role**.
2. Click **Create invitation link** → **Copy link**. Send the link privately through your usual communication channel; V1 does not email it automatically.
3. The invitee opens the link, signs in with the exact invited, verified email and clicks **Accept invitation**. After email confirmation, reopen the invitation link if necessary. Links expire after seven days.

Workspace privacy. All active members of a workspace can read its operational records and attachments. Assignment is not a privacy setting. Use separate workspaces for unrelated clients, and share sensitive information only where every member is authorized to see it.

Know where to work

Screen	Use it for
My Day	Open assigned work, follow-up duties and owned issues. It can include future tasks, not just today's deadlines.
All work	Find task runs, including completed records. The search box searches task titles.
Processes & SOPs	Create and edit drafts, view published instructions, start runs and manage recurring schedules.
Attention required	Find pending permissions, open issues and work that is waiting, blocked or ready for review.
Deadlines	View open runs that have due dates. This is a view of tasks, not a separate compliance database.
Handovers	Record the trainee, trainer, training stage and process-ownership sign-off.
Weekly report	View workspace totals and copy a weekly summary.
Team & access	Manage invitations, workspace roles and deliberate offboarding.
Notifications / Activity	Read notices and inspect recorded actions and decisions.
Settings	Update your profile; authorized users manage workspace settings and automation health.

The three records you use most

Process / SOP: reusable instructions, decision boundaries, resources and checklist steps. A draft must be published before you can start runs from it.

Run: one task occurrence. Put a clear document, request, order or case reference in its title and reference field. One process can have many runs.

Issue: a problem linked to a run, with a responsible person, recommended next action and follow-up date. An unresolved blocking issue prevents submission.

Understand the statuses

The usual reviewed flow is **Not started** → **In progress** → **For review** → **Completed**. **Changes requested** means you must correct and resubmit. Runs without final review use **Complete work**. **Blocked** and **Waiting on client** keep work open; **Cancelled** records work a manager deliberately stops.

Overdue is separate. A task can be both waiting on the client and overdue. A waiting status does not remove its business deadline. Dashboard totals may cover the entire workspace, not only your work.

On small screens, use the **Workspace page** dropdown. Check the selected client before entering data. Refresh after another person saves a decision or comment; V1 is not a live-updating chat feed.

Create your first SOP

Start with a routine that has a clear outcome. The example below is a **Weekly file and document check**: inspect an agreed folder, identify missing or outdated items, and record what was fixed or escalated. This is a custom example, not a preloaded template.

Create the process

1. As an owner or authorized manager, open **Processes & SOPs → + Create process**. Enter the **Process title** and a short description.
2. In **SOP / how to perform the work**, describe the folder to inspect, the approved document list, what to check and what a correct result looks like.
3. Complete **VA can do**, **Ask first** and **Never do**. For this example: inspect and record; ask before deleting or changing shared access; never remove client records without authority.
4. Add approved folder and checklist links under **Resources**, one “Label | actual URL” per line. Do not include passwords or access tokens.
5. Use **+ Add step**, or **Paste an existing checklist → Append as steps**. Pasted lines are appended; remove the placeholder “First step” if it is not needed.

Suggested step	Configuration and expected result
Confirm the folder and review period	Required text or URL identifying the exact location and coverage.
Compare against the approved document list	Required checkbox with instructions that define what must be checked.
Record missing or outdated items	Required text; write “None” when no exceptions are found.
Record permitted corrections	Required text describing the actual changes, or “None.”
Attach the review record	A required file/screenshot only when that evidence is useful and approved.

Publish before assigning

For the training run, select **Require review after submission**. Click **Save draft**, then **Publish draft** in the process list. Use **View SOP** to inspect the published version. VAs can author drafts; owners/managers publish them.

Configure the actual outcome. Use checkbox, text, number, amount, date, URL, yes/no or dropdown inputs as appropriate. A saved “No” is still an answer; it does not automatically create an issue. Record exceptions explicitly and never mark a failed check as passed.

Create runs and schedules

Assign the first practice run

1. In **Processes & SOPs**, click **Start run** beside the published process. Alternatively choose **+ New work** and select the process under **Start from**.
2. Enter a specific **Task title**, such as “File check | Shared folder | DEMO-001.” Select the **Assignee** and, for this practice run, a separate **Reviewer**.
3. Choose the agreed **Due date** in the client timezone. Add “DEMO-001” under **Order / invoice / product reference** and the approved folder under **Source link**. Click **Create work**.

The reference field also works for document or request IDs despite its label. A process with review or a permission gate needs a different active owner, manager or client as reviewer. A VA can create work for themselves, not assign it to other members.

Schedule a recurring check

As owner/manager, open **Processes & SOPs → + Recurring schedule**. The values below are practice settings; agree on real working days and deadlines with the client.

Field	Practice setting
Published process	Weekly file and document check
Assignee / Reviewer	The assigned VA / a separate authorized reviewer
Repeat / Day of week	Every week / Friday
Deadline time / Schedule timezone	15:00 / the client's configured operational timezone
Create work ahead of deadline	1 day before

1. Click **Save schedule**. Check **Next deadline to generate**, the timezone and the lead time.
2. Use **Generate due work** once the next occurrence is inside its lead-time window. Work that is still too far in the future is not generated yet.
3. Check **All work** or the assignee's **My Day**. Generating the same scheduled occurrence again should not create a duplicate.

Generation is not execution. A schedule creates a checklist run; it does not perform the check. Unattended generation and reminders need the configured background worker. Otherwise, an owner/manager must generate manually. Check Settings → Automation health.

One schedule creates one run per occurrence, not one run per file, customer or product. Define coverage clearly. Pausing does not cancel existing runs. Editing affects future generation; resuming may generate missed occurrences. Review the next deadline after changes.

Execute, save and attach proof

1. Open the correct workspace and **My Day**. Select the run, check its reference and deadline, then open **View SOP**. Follow the version saved with that run.
2. Use **Update status / follow-up → In progress / reopen**, enter a short reason and click **Update status**. Perform the real work in the approved external tool.
3. Open each step's **How to do this / expected result** instructions. Enter an honest result, or check **I completed and checked this step** only after doing it.
4. Click **Save step** and wait for **Saved**. Save one changed step at a time. Only successfully saved answers survive a reload.
5. When proof is required, expand **Attach evidence**, choose the file and **Evidence label**, then click **Upload and attach**. Wait for the file to appear and confirm that **Open** works.
6. Add a task comment for useful context. Resolve required permissions and blocking issues before submission.
7. Click **Submit for review**, or **Complete work** when final review is not required. A fully answered counter alone does not finish the run.

Before-and-after evidence

For a step configured with **Before and after files**, attach the original state with label **Before** and the verified result with label **After**. Two files labelled General do not satisfy that requirement. Use this pattern for an approved document, content or settings update.

If the step has **Permission before action**, obtain permission before the app unlocks its answer/upload controls. Do not make the external change while the decision is pending.

When the work is interrupted

If an upload fails, use **Retry upload**. Use **Discard selection** only to abandon a selected file; it does not satisfy required evidence or delete an attached file. Do not leave while an upload is unfinished or the page warns of unsaved work.

If a stale-save warning appears, stop, refresh and inspect the newer saved state. Do not force an overwrite or assume unsaved text was retained. Avoid simultaneous editing of the same run.

Upload only appropriate files. V1 accepts PNG, JPEG, WebP, PDF, plain text and CSV up to 10 MB. Word and Excel files are not accepted directly; use an approved resource link or a suitable permitted export. Remove unnecessary personal details and never upload credentials.

Use **Not applicable** only when the template allows it and the step genuinely does not apply. Provide the required reason. It is not a substitute for missing information, permission or unfinished work.

Ask, wait, correct and finish

A. Ask before taking an action

Permission before action is different from final review. Use it where the client must authorize an action before it happens, such as publishing a document or changing approved content.

1. The VA opens the locked step and clicks **Request permission**, describing the exact proposed action and reason. Do not act externally yet.
2. The reviewer opens **Attention required → Permission before action**, opens the run and finds **Permission history → Make decision**.
3. The reviewer selects **Approve this action** or **Reject / request clarification**, adds a decision note and clicks **Record decision**. The VA refreshes and follows only the approved scope.

B. Report a problem with a next-action owner

1. Inside the run, open **Issues & exceptions → + Report issue**.
2. Enter **Issue title**, **What happened / what did you investigate?**, **Recommended next action**, **Next-action owner** and a **Follow up** date.
3. Keep **Must be resolved before this run can be submitted** selected only when the issue should block completion. Click **Create issue**.
4. When resolved, the issue owner or manager uses **Resolve issue**, explains what changed and clicks **Resolve**. A comment alone does not close it.

When the entire run is waiting, also use **Update status / follow-up**. Select **Waiting on client** or **Blocked**, explain what is needed and set the responsible person and follow-up owner/date. The issue record and task status are separate; keep both accurate.

Waiting for someone outside the workspace? Select the internal team member responsible for the follow-up and identify the external dependency in the reason. Do not invite a supplier or customer merely to populate the waiting-person field.

C. Submit work and handle corrections

1. The VA saves all required answers and evidence, then selects **Submit for review**. Execution is read-only while the run is **For review**.
2. The reviewer opens **Review submitted work**, chooses **Request corrections**, explains the change and clicks **Record review**.
3. The VA refreshes, reads **Reviewer feedback**, corrects and saves the affected steps, then resubmits. When satisfied, the reviewer chooses **Accept and complete → Record review**.

Example feedback: "The evidence does not identify DEMO-001. Add a file that shows the correct reference." Do not approve work merely because every field is answered.

Inbox review and document collection

Daily inbox review

Create a **Daily inbox review** process for the accounts you are authorized to access. You may adapt the built-in **Daily marketplace mail review** template by changing its title and instructions. The email review itself happens in the approved email tool.

1. Define the accounts, folders, routine actions and escalation rules in the SOP. Save and publish. Agree on daily or weekday coverage before adding a recurring schedule.
2. Open the run and review the actual messages. Record the relevant request, source link and exact deadline. Save each answer.
3. For every actionable obligation, also create + **New work** with its own title, reference and due date. Notes in an inbox-check run do not automatically create tasks.
4. Handle only permitted routine work. Report exceptions with a recommendation, next-action owner and follow-up date. Check **Deadlines** to confirm dated tasks are visible.

Do not guess an ambiguous deadline. Record the original instruction and ask the responsible person to confirm the actual date and timezone. V1 has no business-holiday calendar. A task reminder is not a substitute for confirming the obligation.

Invoice or receipt collection

Use **Invoice collection and handoff** for tracking one requested invoice from collection to the agreed destination. The process does not authorize payment or determine accounting treatment.

1. Under **Processes & SOPs**, select the template with **Use template**. Set the approved document checks, destination and review rule; save and publish.
2. Create "Collect invoice | DEMO-INV-001." Assign the VA, choose a separate reviewer when required, and record the supplier, period or request reference.
3. Locate the document and save **Locate the invoice**. Check it against the request, save **Verify invoice details** and attach the permitted file.
4. Send the document through the approved external channel. Save **Record the bookkeeping handoff reference** with the actual message reference or receipt.
5. If the document is missing, leave its step unfinished and create an issue with an internal owner and follow-up date. Submit when the required outcome is complete.

For non-financial documents, create a similar process with the appropriate recipient and checks. Keep one run per document or use an explicitly defined batch with a coverage list.

Research, preparation and follow-ups

A. Prepare a research brief

1. Choose + **New work** → **Start from** → **Quick one-off task**. Enter “Research brief | DEMO-REQ-001.”
2. In **Instructions and acceptance criteria**, define the topic, the required deliverable and the approved places to research. Example: “Prepare a comparison table covering the requested options and include a link for each finding.”
3. Select **Review required** when the client must check the result. Select **Evidence file required** if a permitted export should be attached. Set the assignee, separate reviewer, deadline and reference; click **Create work**.
4. Prepare the brief externally, record its approved link or attach a permitted export, save the completion step and submit. Ask for clarification when the scope or acceptance criteria are incomplete.

A quick task has one completion step. When research becomes a repeatable activity with several checks, create and publish a reusable process rather than relying on a long free-text instruction.

B. Prepare a meeting pack

Create a **Meeting preparation** process with checks for the agreed date/time, agenda, relevant documents, access links and delivery to the organizer. Start one run per meeting and put the meeting reference in its title.

Prepare and share the pack through the approved external tools, then record the final location or delivery reference. Report missing agenda items with a next-action owner. Do not mark preparation complete while required materials are still missing.

Preparation is not scheduling. VA Relay does not create calendar events or send meeting invitations in V1. Make those changes only in the approved calendar tool and only within the client's instructions. Record the outcome in the run.

C. Follow up on an outstanding request

1. Open the related run and check the last contact, next action and agreed follow-up date. Avoid creating duplicate tasks for the same obligation.
2. Complete the permitted follow-up in the external communication tool. Add a factual comment with the actual outcome, without unnecessary personal information.
3. If still waiting, update the responsible person, follow-up owner/date and reason. If resolved, close the issue and complete the remaining checklist steps.

“I sent a follow-up” completes a task only when that is the defined outcome. It does not complete a request whose required outcome is receiving a document, obtaining approval or confirming a resolution.

Publishing checks and recurring deadlines

Apply an approved update

Use a process for a document, page, listing or account-setting change. Define exactly what may change, who authorizes it, where the approved content lives and how to verify the result.

1. Create and publish the process. Include the target reference, approved instructions, verification steps and evidence. Enable **Permission before action** where authorization is needed.
2. Start a run such as “Approved content update | DEMO-CHANGE-001.” Assign the VA and the authorized separate reviewer. Set the agreed client-local deadline.
3. Request permission if configured. After approval, record the original state, perform only the approved change externally and verify the visible result.
4. For a step requiring **Before and after files**, upload the two files with the correct labels. Log any discrepancy or unsuccessful change as an issue.
5. Save the results and submit. If a temporary change must later be removed or reversed, create a separate dated run with the same reference and the approved final state.

Temporary changes need an end task. Completing a start or publishing run does not automatically create a removal task. V1 has no campaign start/end automation and does not publish to external channels. An app permission cannot prevent someone acting directly in an external tool.

Track a recurring document submission

Create a **Monthly document submission** process for an agreed report or document pack. Confirm the recipient, reporting period, required files, deadline wording and timezone before scheduling it.

1. Add preparation, verification, delivery and proof-of-submission steps. Use a required text field for the reporting period or case reference.
2. Create a monthly schedule using the confirmed due date and a lead time that gives enough preparation time. Any internal buffer date must be explicitly agreed.
3. Prepare and verify the pack, submit through the approved external channel, and record the actual delivery receipt or reference.
4. Raise missing-data issues early. Keep the business deadline visible even while waiting. A schedule edit affects future generation, not existing runs.

Use separate runs when obligations have different owners, recipients or deadlines. **Deadlines** shows dated work; it does not determine legal requirements, calculate reporting rules or submit documents on your behalf.

Hand over processes responsibly

Record training progress

Use **Handovers** to track readiness for a process, not just whether a task was assigned. A practical sequence is demonstration, guided practice, independent practice, SOP drafting, approval and ownership.

1. The owner/manager opens **Handovers** → **+ Add handover**. Select the process, **VA / trainee**, **Trainer** and **not started**. Click **Save**.
2. After each real training activity, the assigned trainer or manager selects **Update** and records the stage and a meaningful progress note.
3. For SOP approval and ownership, use a published SOP, a separate authorized sign-off person and a written sign-off note.

App stage	What to record
demonstration	The trainer has shown the process and explained its decision boundaries.
guided run	The trainee has completed a practice run with supervision.
independent run	The trainee has performed the work independently and the result has been checked.
sop drafted	The reusable instructions have been written and saved as a draft.
sop approved	The agreed SOP is published and a separate authorized person records approval.
owned	The agreed responsibility is formally handed over, with a written sign-off.

Training and permissions are different. Publishing a draft does not automatically advance the handover stage. Marking a process owned does not change application roles or grant wider business authority. Record actual progress; a date alone does not prove readiness.

When instructions change

Edit the process draft, obtain the required approval and publish the revision. New runs use the latest published version. Existing runs retain the version they started with. Tell the affected VA what changed; do not assume an old run has updated silently.

When someone is away or leaves

For temporary cover, an authorized manager uses **Reassign / deadline** on the run and records the reason. Preserve the deadline unless an authorized change is agreed, and explain unfinished work in the handover note or comment.

For access removal, use **Team & access** → **Offboard**, choose a replacement and enter the handover note. Review unfinished tasks and reviewer assignments; transfers that create self-review are rejected. History remains, but already downloaded or exported information cannot be recalled.

Adapt these everyday VA workflows

These are optional configurations, not preloaded tasks or a universal job description. Choose only the work covered by your client agreement. Define the deliverable, decision boundary, evidence and deadline before publishing each process.

Workflow	How to organize it	Completion record
Access setup	One onboarding run per agreed set of tools. Add approved links and an access-test step.	Access works or an unresolved permission issue has an owner. Never store credentials.
Inbox review	One scheduled review plus separate dated tasks for actionable requests.	Review is complete; requests and deadlines are recorded and routed.
Document collection	One run per document, or a batch with an explicit coverage list.	The correct file reaches the agreed destination; record the handoff reference.
Meeting preparation	One run per meeting, covering agenda, documents, links and delivery.	The organizer has the agreed pack. Missing materials remain visible.
File organization	A defined folder review with approved naming and movement rules.	Changes are logged; uncertain deletion or access changes are escalated.
Data entry / cleanup	One run per dataset or batch; link the approved input and define validation checks.	The agreed records are entered and checked; exceptions are documented.
Research brief	A quick task or reusable research checklist with scope and acceptance criteria.	Findings and supporting links are delivered for the agreed review.
Routine reporting	One run per reporting period with data checks and delivery steps.	The report is checked and shared with a delivery reference.

Use titles that are easy to find

Use **[Work type]** | **[Target or period]** | **[Reference]**. Examples: “Research | Vendor options | DEMO-REQ-001” and “Document collection | Monthly pack | DEMO-DOC-001.” Put the important identifier in the title as well as the reference field.

Keep the scope visible. Title search does not search every attachment, comment or reference field. For batches, attach or link a coverage list and specify what was checked. Do not hide many unrelated obligations inside one generic checkbox.

Adapt workflows to the client's business

Use these examples only where they fit your responsibilities. Actions take place in the client's approved external tools. The run records what was requested, what happened and what must happen next.

Workflow	How to organize it	Boundary or outcome
Client or lead follow-up	One run per request or a clearly scoped contact batch; record next action and follow-up date.	Use approved communication and scope. A sent message is not always the final outcome.
Content preparation	One run per brief, asset or publishing pack; link the approved materials.	Prepared work is reviewed before any restricted publication or commitment.
Page or listing check	One run per page/listing, or a batch with a coverage record.	Compare with approved content, record findings and route unauthorized changes.
Temporary update	Separate start and end runs with a shared reference and before/after checks.	The approved change is verified and later removal has its own deadline.
Order or shipment follow-up	One run per order/shipment with references, status checks and a follow-up owner.	Complete only the defined delivery or resolution outcome; do not invent refund authority.
Invoice handoff	Use the built-in collection template, adapted to the client's approved checks and recipient.	Record delivery to the agreed destination. Collection does not authorize payment.
Account issue investigation	A case-specific run with evidence, investigation, recommendation and a responsible decision-maker.	Keep restricted account or financial actions with the authorized person.
Recurring document submission	One run per period and obligation, with confirmed deadline and proof-of-delivery steps.	The correct pack is sent on time. The app does not decide reporting requirements.

Choose a reasonable review level

Use final review for training or work that benefits from inspection. Use permission before action for sensitive decisions. Do not require screenshots and approval for every low-risk checkbox unless the client has a reason to do so.

Your role determines access, not business authority. A broad application role does not authorize purchases, payments, refunds, legal changes or public commitments. Put the actual VA can do, Ask first and Never do rules in each SOP.

Keep work visible from start to finish

At the start of your shift

Open the correct workspace and **My Day**. Review overdue work, due follow-ups and upcoming deadlines. Check **Notifications** and reviewer feedback. Start the highest-priority agreed task, read its SOP and save each completed step. Review **Deadlines** even when an obligation is not due today.

Before you sign out

Save changed answers and confirm uploads. Submit work that is ready. Give unfinished items an accurate status, next action, responsible person and follow-up date where needed. Add a factual handover comment. Do not mark waiting work complete to clear the queue.

For the client or reviewer

Open **Attention required** and act on pending permissions, submissions and assigned issues. Record decisions in the actual run, not only in chat. Acknowledge what was checked, request specific corrections and avoid leaving the VA without a next action.

Copy the weekly summary

Open **Weekly report** → **Copy weekly summary** and paste it into the team's normal communication channel. Add highlights manually. V1 does not write an AI narrative or automatically email this summary each week.

The counters cover the whole workspace. The on-time measure reflects final submission timing for accepted work completed that week with deadlines; it is not hours worked or an individual-VA score. Owner, manager and client roles can export task CSV or workspace JSON. VAs can copy the summary but have no export button in V1.

Practice before using live client records

Exercise	Expected result
Save and reopen a dummy task	Saved answers remain; unfinished steps remain unfinished.
Submit without required evidence	Completion is refused until the required proof is saved.
Request a correction as reviewer	The VA can read feedback, correct, save and resubmit.
Request permission as the VA	A separate reviewer decides; the VA refreshes before acting.
Mark a past-due task as waiting	Waiting and overdue remain visible together.
Generate the same due schedule twice	No duplicate occurrence is created.
Check access to a separate client workspace	The workspace is unavailable without explicit membership.

Practice with dummy information. These exercises are a readiness checklist, not a guarantee that your deployment has passed them. Have the administrator resolve failed checks before introducing live client work.

Troubleshooting and safe use

Problem	What to check
No Start run action	Save and publish the process first. Drafts cannot be used for new runs.
No eligible reviewer	Invite a separate active owner, manager or client. A VA cannot self-review.
Submit is disabled or rejected	Save changes; finish or discard pending uploads. Check required answers, evidence, permission gates and blocking issues.
No scheduled run appears	Check publication, active assignments, timezone, lead time and worker/manual generation.
An upload fails	Check permitted file type and the 10 MB limit. Retry; do not treat a selected file as attached.
Old instructions are still shown	An existing run keeps its original SOP snapshot. Ask the manager how to handle a material change.
A decision or comment is missing	Refresh the run. Updates are not pushed as a realtime conversation.
No notification email arrives	Use in-app notices and ask the administrator to check email and worker configuration.

What V1 does and does not do

External actions: resource links open your approved tools. V1 does not read an inbox, send client messages, book meetings, publish content, pay invoices or independently verify external work.

Saving and sharing: save answers explicitly. There is no offline mode or automatic answer autosave. Share invitation links and weekly summaries manually. Background reminders and scheduled generation depend on administrator configuration.

Schedules: daily, weekday, weekly and monthly fixed schedules are available. There is no holiday calendar, quarterly builder, completion-relative recurrence or automatic campaign start/end pairing. Use **Reassign / deadline** with an explanation to change an existing run's deadline.

Templates: V1 includes Daily marketplace mail review, Invoice collection and handoff, and Weekly listing check. The other examples in this guide must be created, reviewed and published by the team.

Data safety: use only authorized workspaces and approved files. Exported records include attachment references, not attachment bytes; exports are not a full backup or an import feature. Ask the administrator to verify access and backup/restore procedures before storing sensitive client records.

The daily rule. Read the instructions. Do the actual work. Save the result. Attach the right proof. Ask the responsible person when needed. Complete only the outcome you were assigned.
